WORK PRO 

a “Swiss knife” for **lighting control**

LM 5

With LM 5 forget about old lighting consoles and static applications. Adapt it to fit your needs. Control the light and audio without making a big investment.

LM 5 is a plug&play solution which allows users to control remotely audio and lighting devices. Its design permits to integrate it into an existing installation using its connectivity. This small but powerful device replaces classic control consoles: it can be controlled locally through wall-mounted controllers or remotely using mobile devices such as smartphones or tablets thanks to intuitive presets (layouts).

LM 5, much more than a control device

- With LM 5, users do not have to limitate the configuration of their current installation but it makes possible to change it according to the specific needs, taste or one-time applications. It is so easy as editing a new layout. There is no need to wire up the place.
- LM 5 makes possible to control lighting and audio from a single device.
- This is an innovative and intuitive controller that leaves old lighting consoles behind, which require previous handling knowledge.
- LM 5 can work as a backup device thanks to its inner memory which is able to store and trigger scenes.

Control light and audio from just one device

The integration capacity of this device can be demonstrated by the possibility of controlling not just the lighting but also the audio.

In the domestic sphere, a good integration solution would be the use of amplified speakers IC6 PROA, remotely controllable, or to design an installation with SLA amplifiers that allow a zonal control of the volume.

Another interesting solution for an installation which requires different audio sources that need to be alternated between them is the mixer/amplifier DCA 1, which makes possible to choose between several connected sources and control their volume.

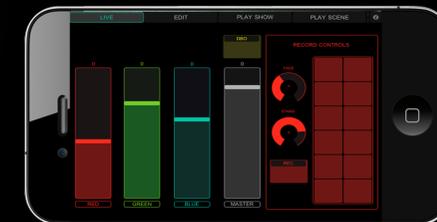

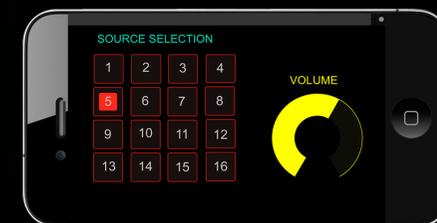

All of these controlling audio solutions can be combined with a lighting control. Everything is included in just one device: LM 5.

How to control an installation?

SIMPLE AND INTUITIVE LAYOUTS

A layout is a visual, intuitive and 100% configurable kind of controller. Just pressing or sliding a finger on the screen of a smartphone or a tablet it is possible to modify the light intensity, the audio volume or choose a specific audio source.

A layout is easily editable: if there is a change in the installation, we can add or remove controls and functions. These layouts are compatible with iOS and Android devices.

AR 5N: A WALL-MOUNTED CONTROLLER

AR 5N is another possibility to control the LM 5. This is a wall controller which allows to select the scenes previously stored in the LM 5 and trigger them as well as to control the master channel level.
